

We typically call volume less than the previous two intervals low volume.

Low volume, or low activity, signs of strength or weakness include No Demand, No Supply, Tests, No buying Pressure and No Selling Pressure.

The term 'swamping' should conjure up a mental image of a lot of one thing overwhelming something else. Therefore this would have to be happening on increasing activity (volume). So Demand swamping Supply would need to be on an increasing volume bar. By definition, this would not be volume less than the previous two bars, or low volume. And in reality, the greater the volume or activity the more swamping that is likely taking place.
