

First off EURUSD moved 43 pips today... please kill me now 🤖

You can't make this stuff up. No slight of hand and nothing up my sleeve. VZA is a simple but yet at the same time extremely powerful tool for knowing the where. It's up to you to find the who, what and why to round out the trade but once you know the where you stop wasting time. If you know a zone was proven to be controlled by buyers and we come back to the high and see a test you know that a long should be a safe play. 100% guaranteed, nope, never but in this business anything we can do to stack the odds and reduce the risk leads to greater chance of long term profit and success. If you have spent anytime studying R:R and differing risk models (such as % versus fixed) you know that you can be long term profitable on a lower win rate if your winners attain better than 1:1 risk reward. The better the average R:R you can achieve on your winners the lower the win rate needed to still be profitable and reduce your risk of busting out.

Back to my point (I tend to start typing and get off topic)...

Nice simple 1 zone on EURUSD let's say 1hour chart, highest volume zone when looking at a normal zoom chart where I can see March 31st through to today. First chart shows this with the zone applied as a yellow fib. As we can see L, 50% and H all played roles in the PA that followed after price came back into the zone and eventually broke the high. If you have followed my recent posts I have shown this zone already... April 3rd.

*Attached Image (click to enlarge)*

Next up a zoomed in 5 min chart where I have marked 2 red vertical lines highlighting all of the bars that made up that 1 hour bar from the previous chart. As you can see there were 4 UHV bars that made up that 1hr zone. Interestingly enough those 4 bars cover the full range of the zone. This is NOT always the case. For the purpose of this post I will focus on just the bar that made the highest single volume which is marked with the white vertical line and a white fib.

Up next let's look at the 1 hour chart again now with the two zones applied and what do we see? To try and make things easier to see I will zoom in so you can see the 3 day period between Apr 7th and 9th which is when price entered the zone, traveled through, broke the high, tested and moved up.

As you can see the new white 5min zone again played a key role. April 8th we enter the space between the white zone L and the yellow zone 50% where we range for 3 bars. Next bar we hit the 50% of the white zone finding some temp resistance before pushing up and taking out the white zone high before hitting more formidable resistance at the yellow zone high. Sideways range from here until the 9th. During the 9th we dip back into the upper half of the white zone before finding buyers at the 50% level. Back up finding more resistance at the yellow zone high before finding support at the white zone high, sideways moved and a push up and out. Return to test and boom up we go from that yellow zone high.

These are not just random lines and you don't need a math degree to calculate them. No pivots, no S1 or R1 just simple easy to apply volume (activity) zones. Again not showing any trades here but I am sure you might spot a few possibilities over just that 3 days and only looking at this zoomed in 1 hour chart. As you can see by dropping down and finding the key 5 mins of volume within that 1 hour zone we were able to further dissect that zone even further to the point where we basically explained each and every pause, range and movement onward as price made the trek from the zone L to zone H.

One of the simplest TF pairings to trade is to take 1hr UHV preferably WRB zones and find 5min VSA entries into each of the 3 levels grabbing the pips from level to level to level...

To finish off yet another long winded post (and when I said I was tired of posting on this forum as it's dead) back to a normal zoom 1 hour chart. See yet again how when price came back to these zones this week we entered that space between the yellow and white zones, range sideways, push back up and the back to the high on NS finding support again.

Where will we go from here? Who really knows. What I do know is the levels where I will expect to see trade set-ups occur and then once in a trade I know where the most likely turn, pause and stop points are

for my trade management.
