

dove_alliance :

Hello traders and blessing -

I am not here to train but to post some advice; and one of the greatest advice an experience trader gives is you never, ever trade against the trend. It matters not if the market is ranging or consolidating - there is always a trend.

The Paradox was given to you with rules that are set in stone; and if you break the rules - you will lose. If you create your own rules - you will lose. If you try to interpret or shift the rules for your own benefit, and/or what you think will happen - you will lose.

I have stated it very clearly throughout my tutorials that the 1 hour chart (H1) IS NOT A TRADING CHART but ONLY a reference chart for the 2 hour (H2) chart which is your trading and trend chart. The 1 hour is only a reference for syncs WITH the 2 hour chart. And by trading the 1 hour chart takes you into the perfect storm of becoming a loser.

There are only two venues of being a trader:

1 - being objective.

Or:

2 - being subjective.

Being objective is also being steadfast with faith, believing, and controlling your own emotions.

Being subjective is also being intimidated with the market having control.

Being objective means you never, ever chase the market but let the market come to you.

Which chart controls the trend? The answer is the H2 chart.

What is trend with the H2 chart? The answer is ROMAR as primary and it changes trend when it crosses EMA. Above EMA is in a downtrend - below EMA is in an uptrend. Your secondary trend are the Parabolics. And the Parabolics is in control of the 4 horsemen. This means if the Parabolic does not flip then you are in a slider going back into the original trend.

The only way the market can change direction (either reversal or swing) is with the FLIP OF THE PARABOLIC. And that is with EMA at or crossing Purple. If you are trading against the parabolic trend then you are also losing your trades. Which also means you are breaking the rules of trading.

The Paradox is telling you a story from bar to bar and I havent seen anyone listening to what the Paradox is saying.

The greatest mistake a trader can make is predicting or thinking what the market will do. The Paradox is 100% correct but your thinking is not. You would be lucky to be 30% correct with your thinking.

I also see a lot of trading plans correct in matching the H1 in sync with the H2. But those plans are very seldom ever traded. That means too much fear in believing what you are seeing not being true. This traders is what I would call shameful in not following through with your own plans. Because someone says something that does not match up with your plans does not mean that person is right. On the contrary - you are right. Your trading plan is your greatest tool in getting you into the right trade (provided your plan is with the trend). And getting into the right trade is when the H1 is in sync with the H2.

With this entry I rode the trend. When the SAR retraced on the H2 I took a second entry and rode both entries to the top. Because of the rule of first in and first out I took 210 pips with the first entry and then 131 with the second entry.

Everything is there for you in all of my tutorials - nothing has been left out. All you need to do is learn the rules for trading.

dove_alliance :

I always have traders asking what is "confluence". So what does confluence mean in trading?

Trading confluence means a trader is analyzing various indicators providing confirmation of Support and/or Resistance at a similar or same spot on a chart or various charts.

When various indicators are confirming a spot on the chart, or charts to be of importance, then the likelihood of price in fact reacting to this level increases. In general, price moves from one level of support to the next level of resistance, and it is the traders judgment to analyze which levels are worth trading. By having layers of confluence at one spot, the trader improves their ability to understand which levels are critical and worth trading.

Ultimately each concept used when trading should lead to an improved reward to risk balance in relation to the profitability. Trading confluence helps achieve that goal. How does trading confluence achieve that?

Simply put, the reason is this:

1) Each indicator has an expected win rate, expected reward to risk, expected drawdown. These expectations and averages vary from time to time, depending on the market structure. For instance, trending trades work great when the market is moving, but range traders are more successful when the market is having a slower day.

2) By combining indicators, the trader is eliminating the weaknesses of each indicator when used separately. In other words, the trader effectively decreases the risk of relying on one particular technique and thereby receives more confirmation for a setup. When a trader utilizes the confluence concept, a trader can choose to filter out trade setups where multiple indicators are not in harmony and in sync. The trader thereby increases the overall aggregate performance.

That is why finding balance is a vital realization when trading confluence. A balance needs to be found in various elements such as:

How indicators need to be aligned when a trader is using certain indicators, it does not mean that all of them need to be aligned; but they all must meet at support or resistance. Traders can look for a certain mixture of confluence, although this can be better achieved when trading with a discretionary method. Which mix is required can depend on the market structure to enhance results.

Find 3 reasons to take the trade and make sure that their maximum confluences but preferably zero reasons not to take a trade.

The goal is to find a balance and equilibrium when using confluence which matches and fulfills the various goals each one of us has formulated. Multiple time frame analysis can be used for trading confluence as well but must meet the 3 reasons on all charts.

Another element that requires attention is whether there is potential syn-energy between indicators and/or charts or a complete lack of it. For instance, using the MACD to measure whether trend has reached a position of reversing would make little sense if there is no confluence; but looking for divergence however is a different story and does make sense because then you have confluence. However, using Fibonacci retracements and targets to see at which levels the two do match and meet makes perfectly sense and is a great example of trading confluence using well matching indicators.

Bottom line:

Confluence is the real truth in trading as regards with support and resistance. Confluence has no deviation. The market structure always move from resistance to support and vice-versa. It is a constant cycle which places confluence at all levels with two or more indicators flowing separately towards the same spot..

shinny:

Here is my 40 pip trade for today.

I bought on the pullback and close above 2hr ROMAR and 4 Horsemen, as indicated by the arrow on my chart. We are in Consolidation in a Daily slider with Purple sliding under White. We have had a very strong 100% uptrend since early November. A pretty straightforward 40 pip trade.

[illegible]

Dec 13, 2016 – pg 337

shinny:

Hello Traders

My trade just closed out for +40. I got my entry wrong by a pip or two so it took a long time to close for profit.

Daily is in an uptrend with Purple sliding under White indicating consolidation in the uptrend. All other charts are saying uptrend, so easiest way to trade is with the trend. There were 4-5 chances to enter so hopefully you got it too.

Shinny

Quoting_Clip75

Nice trade. According to my plan I was waiting on market opening above smooth on H2 but when it did it was too far away from support and didn't retrace far enough for me to want to get in before I was out for the night with all the medium impact news and I was exhausted. I saw your entry but what stopped me was purple crossing smooth. I've seen it many times reverse way past the parabolic when this happens especially with daily in consolidation. You must be a paradox master by now and just know which ones to take.

Here's a tip for you:

When I entered, Purple/Smooth had crossed but we were nowhere near a Parabolic flip, so chances are Purple will slide above EMA to keep the trend intact. Plus I had the SAR attachment on the Parabolic, and it was the Daily Open above Daily Smooth. A Confluence of factors. Remember that the Daily is in an Uptrend but with a Slider - that makes all the difference. Look back at your charts and see if you can see the differences with how things react with different scenarios.

Hope that helps.

Shinny

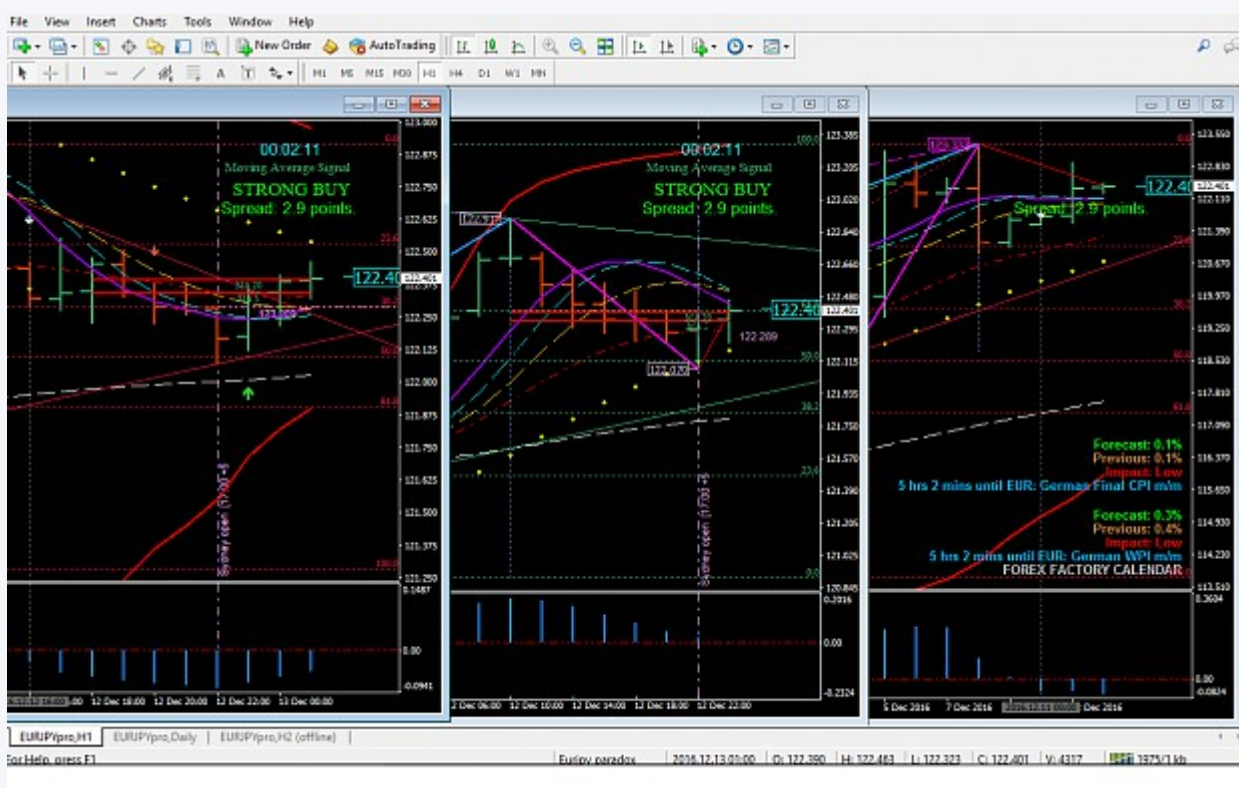

dove alliance :

One thing you are missing is how to read support and resistance. All the indicators are both Support/Resistance. If the trend is up then the indicators are support. If the trend is down then the indicators are resistance. Now - you need to see the big picture concerning support and resistance and your primary support/resistance are the Parabolic's. And the question is: Which chart is your primary? The answer is the H2 and that is with a period.

Looking at your trading plan from yesterday what do you see for an entry going LONG? The answer is the H2 Parabolic hit for entry and 40 TP. Taking trades off support and/or resistance will always guarantee your daily 40.

80% of my trades are off the 17:00 EST candle with the E/J. I do not multiple trade pairs or multiple trade the same pair. The reason is because I know the E/J inside and out, backwards, sideways, and every other way but loose.

Now take a look at the charts you had posted with your trading plan and what do you see on the 2 hour for entry?

As Shaun had mention there was confluence with the entry.

- 1 - the Parabolic hit.
- 2 - the SAR
- 3 - the 50% Fibo hit.

With those confluence in place there was no question which way the market was going with the hit on the Parabolic.

[illegible]

Dec 17, 2016 – pg 341

dove_alliance :

Hello Traders and Blessing;

Let me reiterate the importance of creating a trading plan before you even think of trading. The Paradox was built to look into the future which means every two hour bar (The H2) is in the moment. What happened on the previous two hour bar is history and no longer sees into the future. And every trading plan is created within the 2 hour bar you started your plan on. The History of the indicators had already been plotted and your plan is created accordingly with the plot of the indicators. Which means you are already seeing the direction of the market. As I have said time and again - the Paradox is about support and resistance.

At 17:00 EST the market is recalculated for a new 24 hour period. During the previous 24 hours the market had regenerated support and resistance going into the next 24 hours. And there are many, many traders that do not understand this in which I call the Matrix. This is the period I find the most successful entries during the first 2 hours after the 17:00 mark. This is why your spread generates wide on all pairs. As for myself I do not care about the spread because once I have entered my 40 TP is waiting to be taken. And the reason is because support and/or resistance is waiting to be hit for the entry.

Without a trading plan I would not be able to see the substance of either support or resistance on all three charts. And if you would learn how to create a trading plan correctly then it would only take you about 10 minutes to see exactly the entry point - which is in the moment. In reality you are looking into the future with a trading plan.

+++++

Quoting leelean

Thank you for sharing that which the Holy Spirit has taught you. I was led to this thread about 2 weeks ago and knew I had found something special. I am up to page 40 and have gone over these pages several times. Page 38 Dove is teaching about the daily trading plan on the Euro/yen all makes sense until {image}{image}. Others have asked and Dove has stated that yes it is Support. I need to figure this out before I read any more. I am now asking for help can someone direct me to the rule that I can seem to find which makes EMA SUPPORT when EMA is under...

OK Trader;

For one thing you did not post exactly the scenario that was given on this lesson. You have the H1 and H2 posted but not the DAILY. And the Daily is the trend which was showing the ROMAR uptrend on this posting I had made.

So – let's take my notes on the Daily and place it here:

“NOTES: On this daily is showing an ending of a swing consolidation with ROMAR as support. White/Smooth had crossed Purple and is support with EMA at Purple for support on the uptrend. The Parabolic had been eliminated as resistance with the White crossing Purple. The upper Bollinger Band is within striking distance for a hit.”

Here is my notes on the H2:

“NOTES: The market opened on top of ROMAR support with EMA on top of Smooth/White in a consolidated shallow swing. The parabolic is also holding resistance.”

Here is my notes on the H1:

“Notes: ROMAR is sliding under EMA in holding EMA as support with the white crossing.”

And here my notes for the ENTRY:

“Entry: According with the Daily chart the swing had ended with White, Smooth, and EMA crossing purple for the ROMAR uptrend. The 2 hour is very shallow with EMA, Smooth, and White very tight. And the 1 hour is finishing up its swing. With ROMAR holding support just under the 4 horsemen and resistance being tight above ROMAR; the best entry would to wait for an open candle above either Smooth or EMA. Which ever come first? That places the market above purple for the uptrend.”

“It was the 2nd 2 hour candle after my trading plan that opened above Smooth and took entry. And that was a 40 pip trade.”

Now – lets place this into perspective:

In this period of time with this scenario the market was in a consolidation with all 3 charts showing ROMAR in an uptrend. The Daily was already in an uptrend with EMA, White, and Smooth crossing Purple with an open candle above EMA. This also placed the Daily Parabolic in position for the flip.

On the H2 you have ROMAR sliding under EMA holding support.
On the H1 you have ROMAR holding support just under EMA.

With these scenario in place what is my trading plan saying? It is saying my entry will place EMA as support on ALL 3 charts coming out of a consolidated swing.

And my entry specify this and the bottom line is looking into the future as EMA being support. It is called seeing the big picture in the moment.

I hope this helps you to understand better.

[illegible]

Dec 19, 2016 – pg 343

shinny:

Hello Traders

I wasn't around much earlier so missed the short opportunity but I did manage to take a trade long.

The market hit both Daily PSAR and nearly 23.6% Fibo on Daily. On the 2hr the market hit the BB and we had the fib flipping up. In consolidation, your trading from support to resistance and from resistance to support. The lowest Support was Daily PSAR and FIB so it was a good value buy.

2hr ROMAR is running through the middle of the chart so makes it difficult to use as Support.

I had on my plan this fact and noted my support and resistance levels so I knew what I was going to do. Also, with the force of the 2hr Horsemen going down I needed to see enough Confluence of Support to let me squeeze my 40 pips out.

Before Yellen started her jawboning I moved my stop to +1.

EUR/USD Buy 19/12/2016 21:41:14 674 121.767 122.167 40.2

+++++

dove_alliance :

OK - since I got my trade for today here it is:

Date: 12/19/16 through 12/20/16

Daily:

ROMAR - Support

EMA - Support

PSAR - Support

Check List:

Last MACD 0 crossing – Down

Last EMA Alert Arrow – Down

Last DB Attachment – 124.084

Fibo up or down - Down

Notes: The previous Daily had hit the Parabolic at 23.6 Fibo and the new open bar is just below the Parabolic support. The white had touched Purple but has not eliminate the Parabolic until the next Daily Candle.

2 HR:

OPEN PRICE – 121.739

ROMAR - Resistance

EMA – Resistance with the 4 Horsemen

PSAR - Resistance

Check List:

Last MACD 0 crossing – Down

Last EMA Alert Arrow - Down

Last DB Attachment – 121.671

Fibo up or down - Up

Notes: H2 is in a slider waiting on the BOJ release.

1 HR:

ROMAR – Resistance

EMA – Resistance with the 4 horsemen

PSAR - Resistance

Check List:

Last MACD 0 crossing – Down

Last EMA Alert Arrow – Down

Last DB Attachment – 121.671

Fibo up or down – Up

Notes: H1 in a slider waiting on the BOJ release

Final Notes: The usual time with the BOJ on Tentative is between 23:00 EST and Midnight for the release. Until the release the market will be on hold bringing both the H1 and H2 into a slider. I also expect Tokyo will make some sort of trade between 19:00 and 19:30 EST and I suspect that move will be about 20 pips. My reasoning is because there is no economic news for Tokyo prior to the BOJ release. So I will wait for Tokyo's prop traders to move before I move.

Entry:

Consolidation:

Long: The market is on hold for the BOJ; but I will wait on the H2 to open above purple BEFORE the BOJ release with an entry long for 20 pips, and that will be my trade for the day.

Took the Entry with the H2 open above Purple support to EMA Resistance for 20 pips.

Short:

Adjustment on Plan:

[illegible]

shinny:

Hello Traders

I traded today which is my last day until 2017. And to finish the year I made a mistake with a late entry!

Below is a snippet from my plan from early this morning. And because I wasn't 100% focused on trading, running around getting stuff ready to fly to the UK tomorrow, I missed my entry by 10 pips.

Final Notes for all charts: Daily is up with consolidation. PSAR eliminated as Support. 2hr is in heavy consolidation with fib up. ROMAR/EMA 10 pips apart with Purple stuck in the middle. 2HR PSAR eliminated as Support. Support is 23.6 Fib (38 pips away from ROMAR) and Lower BB. Tradeable Resistance is Upper BB – everything else too constricted together.

ENTRY:

Long: I will take a long trade at Support, either the fib with a DB attachment or a pop down to the lower BB.

Short: I will take a short only on a pop higher to the Upper BB with divergence.

Market adjustments: News at 18.30

So I entered about 10 pips higher than I had planned on doing, it was a risk/mistake but I had some room to move north, so the plan was to move my stop up.

I did manage to get +40, but it wasn't great trading as I chased the market. But we all make mistakes that's for sure.

Can I ask one question? With the 40/40 rule I see that you've mentioned moving your stop to B/E after 20 and to clean up trades with purple/white crossing. Is that just something for more experienced traders? I'm always keeping an eye on my trade because of this but the ones I totally walk away from go the 40. Me watching that screen is not healthy.

Is that just something for more experienced traders? I'm always keeping an eye on my trade because of this but the ones I totally walk away from go the 40. Me watching that screen is not healthy.

That was for the traders that were trading the 40/40 rule and letting it ride with experience. You don't have to sit at the computer all day long. Once you have learn to make a good trading plan - then wait for the entry - pull the trigger and forget about it and do something else. Sitting and watching your trade is not going to change the outcome; but only place more stress on yourself without confidence.

+++++

Like I have said many times - trading is not about making money. It is about learning the skill of being a trader. When you start looking for short-cuts and making excuses is when you get into trouble. After you have gain the skill of a trader is when you can start thinking about the money.

So are you basically saying check our motives and if becoming a great trader isn't in them then move on correct? Last night although my trade lost I made a plan, stuck with it and at the end of it I evaluated and realized my mistake, learned from it and felt it was successful due to that. These are the correct steps and not panic and get out right?

So are you basically saying check our motives and if becoming a great trader isn't in them then move on correct? Last night although my trade lost I made a plan, stuck with it and at the end of it I evaluated and realized my mistake, learned from it and felt it was successful due to that. These are the correct steps and not panic and get out right?

Pretty much so. A lot of new traders come into the forex thinking only about getting rich; not realizing the forex is a Trojan in the wake of taking everything they got. There are traders on this forum that has been here for a decade or more still trying to find a way of getting rich - jumping from one system to another in the hunt for the "holy grail". Not realizing the holy grail lies within themselves if only they learn the skills of becoming a trader. There is no easy way of becoming financially stable in the forex unless you dedicated yourself into reality that the forex is an education of learning the true skills of a trader. Attitude is everything.

For almost a year you have been trying to trade the Paradox and still you don't get it. So here is your check list on all scenarios:

ENTRY:

- A. Confluence on one (and/or) two or more charts.
- B. Off Support for the uptrend and Resistance for the downtrend.
- C. Sync on two or more charts.

- A. Confluence on one (and/or) two or more charts.
- B. Off Support for the uptrend and Resistance for the downtrend.
- C. Sync on two or more charts.

EXITS:

- A. Resistance for an uptrend with a 40+ pip gap from **entry**.
- B. Support for a downtrend with a 40+ pip gap from **entry**.

- A. Resistance for an uptrend with a 40+ pip gap from **entry**.
B. Support for a downtrend with a 40+ pip gap from **entry**.

Very simple and that my friend is what should be showing on your trading plan. Its not complicated provided you follow the rules in gaining your 40 pips daily.

pg 356

"The Paradox is very simple and not complicated. It is a process between 6 months and 12 months of full practice and study." This seems to be a contradiction in terms. But maybe it's like learning a foreign language: English is easy and not complicated at all - after you have learnt it.

Jan 4, 2017 - pg 366

shinny:

Hello Traders and Happy New Year

I am not really trading until next Monday, but as I was about and at a loose end I saw an opportunity to trade and took it.

I think this trade is pretty self explanatory.

Daily just came out of an upward slider, opened today at the 23.6 Fib.

2hr SAR attached this am with ROMAR/EMA about to cross, and PSAR flipped. ROMAR/EMA crossed so I was looking at buying support at PSAR knowing that the last SAR was above, so I will get a lower SAR attachment which will then push higher and both DB/SAR will connect for confirmation on the continuance of the Daily trend.

A pretty straightforward 40 pips.

Any questions, fire away.

EDIT: Sorry, forgot to mention 23.6 fib on 2HR, very important support too.

[illegible]

whitford

Hi Team,

Attached below is my trading plan and H2 chart for my trade today. Entry is identified with the white arrow short @ the test of EMA as resistance after the BB hit prior. Same entry as Contrax above for today.

Whitford Paradox Trading Plan			
Date	12-Jan-17		
Time:	8.45am local time		
	DAILY	2 HR	1 HR
Open Price		122.057	
ROMAR			
EMA			
PSAR			
Last MACD 0 Crossing			
Last EMA Alert Arrow			
Last DB Attachment	121.233	121.233	
Fibo			
DAILY Notes			
DB/SAR Attachement to bottom of candle @ hit of BB with Purple @ EMA for crossing down.			
2HR Notes			
Retrace to 38.2 fibo & smooth as both resistance			
1HR Notes			
Retrace to 50.0 fibo / PSAR and EMA for retest as resistance.			
Final Notes			
Short trade @ Sydney open with test of EMA due to recent hit on BB. Strong downtrend present so only looking for short today. Confluence at this point with 1hr and 2hr in line with daily trend

Jan 13, 2017 – pg 374

shinny:

Hello Traders

I just wanted to post something that you will hopefully find useful. I noticed on some plans that some of you touched upon the Daily Lower BB being hit. But that's it, nothing else was said about it. It is a **very significant** event when the BB is touched like that, just scroll back and see for yourself.

As soon as it happened my ears pricked up and it was headline news on my plan.

Let me just go through with you what I saw and what was on my plan, step by step:

- 1) On the 11th, there was a hit on both the 2hr and Daily Lower BB.
- 2) The rule regarding Hits on the BB on a Downtrend/Consolidated Downtrend are that the market will retrace either to a) Purple and or b) Consolidate sideways to Smooth. The market basically did both of those things plus you got the SAR attach for the short back into the Trend.
- 3) On the 12th, we again got the Lower Daily BB been hit.
- 4) At the same time, the 2hr Lower BB was not hit, and we moved down for divergence to show.

So yesterday the 2hr Lower BB was not hit. That doesn't mean you just buy, but it does mean you should now be paying attention for the turn.

Here is the 2hr Chart, with 2 arrows on it:

The first arrow is exactly where I planned on buying. The reason I didn't is it did not close above 2hr Smooth. Look at the low of that bar, it is **exactly** the same as the Daily Lower BB. We had already had the EMA arrow up, and were waiting on the MACD up arrow. If that bar would have closed above 2hr Smooth, the MACD would also have been an arrow up.

- So 1) Daily Lower BB
2) EMA/MACD set for the Turn Up
3) A retrace and retest of Support and
4) Purple/Smooth cross happening very quickly.

That is perfect confluence and a sure fire trade. And when these come up, you can already have 40 pips before the next more normal set up occurs, which is the 2nd arrow, because you are getting in at the lowest possible point.

I have to tell you that I absolutely LOVE trading from the BB's, because you know that you are getting in at the best possible area. You just have to make sure you understand when you can and when you can't, otherwise you will get burnt.

Whilst I am at it, there is another very important point here, and that is Daily Purple. The market never likes to be away from Daily Purple for too long, again scroll back and take a look. As Dana puts it, balance is very important with the Daily Purple. So that was another point to be noted.

Moving on to the 2nd Arrow. After the first missed trade you basically have two options, one is to buy the close above the EMA, remembering that PSAR is no longer Resistance after the White/Purple Cross. Ideally you want it to be just above the EMA. Or the 2nd option is to wait on a retrace to Purple/EMA as they are set for the cross and the PSAR flips.

Either of those trades you could take up to the 2hr ROMAR, which is also, yes you guessed it, Daily Purple! If you were that way inclined you could also have added, news permitting, at the 2hr opening at Smooth.

And that is the power of the Paradox my friends.

I hope that makes sense and helps. It certainly helps me writing these posts.

[illegible]

Jan 27, 2017 – pg 385

dove alliance :

Traders - when you analyze or think about what you are going to do is when you will lose. Yesterday at the 17:00 ET opening bar you had confluence on all three charts: ROMAR, the Parabolic, and EMA was in an uptrend and still in an uptrend. The entry was at 19:00 with the H1 open below EMA in a slider ending of the swing; the H2 opening just above the Parabolic; and The Daily opening above Purple. So what is there to analyze or even think about. The Paradox says up and all you needed to do is pull the trigger for 40 pips.

The question you must ask yourself - is what objective will end the trend????? And that answer has been posted many times. And another question is how do you figure consolidation when all three charts are in an uptrend with ROMAR, EMA, and the 4 horsemen?

+++++

Traders - let me try to revolutionize something for you. The Parabolic; just like every other indicator of the Paradox are not standard. The Parabolic is flipped mathematically with a hidden LR and not by a candle. Once the Parabolic on the H2 is in sync with the Parabolic Daily chart then there is no stopping the trend. You will have your sliders and retraces off resistance/support, depending on direction with the H2; but it will diffidently turn back into the Daily Parabolic.

When you are creating your trading plans your TOTAL OBJECTIVE with your plan is the TREND; and nothing else. This also includes the Parabolic Trend. If you are looking to counter-trade the Parabolic; then all I got to say is: good luck. In other words - your total objective is being focus on the trend. The trend is ROMAR, EMA, and the PARABOLIC. Once you have the trend set on both the H2 and Daily - then the H1 will be your confirmation for entry into the trend. Your trading plans should only be referencing the trend and nothing else. Even in consolidation - there is a trend. Trying to look both ways will only distract the fact of the trend. Focus only on the trend and you will go a long ways from where you are at now.

Quoting ender600ro

Hello Dove, I start to read your threat 1 year ago when I start to learn the basics of the market! I restart to read again but for me is not to easy to understand Paradox the single problem what I have is: if you want to explain, please, which is the order for ROMAR,EMA,parabolic, smooth,white etc who one of them cancel another one?

There is no cancellation with any of the 4 horsemen per say; and the reason is because they are systematically working together as one unit. This is why the Paradox can be traded on any pair, and with any scenario you can think of. One of the great scenarios with the Paradox is recognizing sliders going back into the original trend. And there is not a system in the world that can that. And that is the problem with most traders because they are not taking time to study each scenarios such as sliders. Each scenario is different and each scenario must be studied. There is not one scenario you can think of that has not been posted on this thread. So if you are trying to place one scenario with another then you will have problems.

20170131NS.png;2165166 eurjpypro-h2-gain-capital-uk-ns.png;2165175 My SL has just been hit. My analysis is that I entered when the market was too close to ROMAR resistance and I should have seen it could bounce off.

Niggig - you should know by now the power of this system. There was no way you was getting past ROMAR. You have the same problem that most traders have and that is thinking by trying to analyze. Instead of thinking you should had waited for the hit on ROMAR and pulled the trigger going short. No thinking about it. You see the Market heading for ROMAR, and you know ROMAR is the wall, and all it takes is a little patience waiting for the "moment". What was interesting with your plan is you had both H1 and H2 ROMAR as resistance on your plan and totally disregard this fact with your entry. You have to stop thinking and let the charts speak to you and listen to what the Paradox is saying. This way you have a greater chance of succeeding.

Hendo

2/1/2017

Session Sydney : EUR/JPY

Daily Open: Below EMA

Romar: Support

EMA: Support

Parabolic: Eliminated

Notes: Purple crossing White down. Trend EMA arrow down. Fibo up. Market hovering around 38.2.

Overall trend is up.

H1

Romar: Resistance

EMA: Resistance

Parabolic: Resistance

Notes: Four Horsemen down. Fibo down.

H2

Romar: Resistance

EMA: Resistance

Parabolic: Resistance

Notes: Purple crossed White, Smooth, EMA, and Romar down. Fibo up. Recent SAR at 121.722. Trend EMA arrow down. MACD zero cross down.

FINAL NOTES: H1 and H2 in with down trend. Will go short off resistance.

Buy:

Sell: Will enter short off retrace to EMA.

Adjustments: Entered short off retrace to Purple, about 7 pips from desired entry. Set TP +40 SL 40.

+++++

pg 392

Hendo

Here is screen shot TP & SL.

Trade evaluation: I feel this was a good trade, as soon as DB attached I knew it would hit TP. H1 ranging was a little nerve racking however, I have 100% confidence in the paradox. As long as the rules are followed, I feel you cannot loose!

+++++

dove_alliance :

Very interesting - and the reason is because you and I had practically made the same trade almost to the pip. I believe this is the first for me. So no need to say you had made an excellent trade.

I do want to make one more comment with this trader before calling it a night:

Hendo was seeing exactly the same as I was seeing in the moment. His trading plan was right on without all the garbage; especially with his final notes. He seen the trend down and waited on for the hit on resistance. To the point, very precise, follow through with his plan, and pulled the trigger. You traders need to take lessons from him on creating trading plans.

Feb 2, 2017 - pg 393

dove_alliance :

Always try to catch EMA crossing Purple within the ROMAR trend. The reason is because this will always give you 40 pips. Once EMA crosses Smooth it will begin to expand outward from Smooth. If you wait too long in using EMA for an entry you may get caught in a slider or a reversal. This is true ONLY on the H2. On the H1 the hits are on the Parabolic's.

Feb 3, 2017 – pg 394

dove_alliance :

A word of wisdom:

When you are in consolidation you have only two options for entry. One is waiting for a breakout and the other is from either support or resistance of the consolidation. Pulling the trigger center of the consolidation; between support and resistance is not only a risk of losing your trade but also being in a trade for possibly days waiting on a breakout. And a breakout could very well go against your trade. You have to remember consolidation is 80% of trading. These means you have to recognize the consolidation for one; and then be focus on support and resistance with your trading plans. And if you are not able to recognize consolidation then stop now and go back and study about consolidations. Believe it or not - consolidations are much easier to trade then trends. And there are traders on this thread will verify that statement. All you need to do is learn.

+++++

There are three trends - EMA crossing Purple changes the EMA trend. ROMAR crossing EMA changes the ROMAR trend. Flip of the Parabolic changes the Parabolic trend.

+++++

There are confusion when you try to relate EMA with ROMAR. Traders think if EMA is below ROMAR it is support. That is true ONLY if EMA is also support in relationship with Purple such as: EMA crossed Purple from the bottom of the cycle it is also support if ROMAR is support. BUT - if ROMAR is support and EMA crosses Purple on the upside of the cycle then EMA is resistance and the chart is in consolidation.

+++++

On this first screen shot and to the left you have ROMAR as support, the Parabolic as support, and EMA as support. Then you had EMA cross Purple and EMA had become Resistance. You also had the Parabolic flipped which place the Parabolic as Resistance; leaving ROMAR as support and in consolidation.

Quoting Welcrazy

I closed the trade before Friday's end, either win or lose this entry was bad: I entered long against romar on both H1,H2, candle didn't open above EMA/PURPLE, the risk for a slippage was high. I should have waited the market to decide what to do, in particular at, 61.8 fibo H2 resistance We had DB/SAR as signal for a retrace back to downtrend On the candle I entered in H1, white crossed purple as signal of starting the consolidation, candle opened below EMA. Waiting few minutes the EMA Alert would pop-up right before the candle I entered...

One thing that is a fact is people having what is called "selective hearing". That also applies to reading; especially traders. They read only what applies to them and forget the rest. So lets take a moment and talk about your trade.

What made this trade bad is to do with two objectives.

1. The Parabolic
2. The SAR.

You made an entry totally against them both: which is called counter-trading. Because the market was in consolidation with your entry the only option at that time for an entry was with the SAR attaching with the Parabolic for 40 pips going down.

This is for everyone - traders are not using the SAR correctively. The SAR is used correctively with the Parabolic. An example is with this traders entry chart. The SAR broke away from the DB and attached with the Parabolic on the other side of Purple for entry going short. Bottom line - the SAR and Parabolic works together for all entries in consolidation and also on retraces in trends.

Any time you have trends you will have both the DB/SAR in the trend. Once you have a retrace pulling back to the other side of Purple, and heading for the Parabolic, you will also have the SAR detached from the DB and attached with the Parabolic (SAR - "Stop And Reverse") back into the trend.

At least you recognized your mistake and that is good.

Feb 6, 2017 – pg 396

Hendo

2/6/2017

Session Sydney : EUR/JPY

Daily Open: Way below Purple

Romar: Support

EMA: Resistance

Parabolic: Resistance

Notes: Four Horsemen in steep downtrend. DB down with divergence attachment. Fibo up.

H1

Romar: Resistance

EMA: Resistance

Parabolic: Resistance

Notes: Four Horsemen in downtrend. DB down with SAR and divergence attachment with green price tag. Fibo up.

H2

Romar: Resistance

EMA: Resistance

Parabolic: Resistance

Notes: Four Horsemen in steep downtrend. DB down with SAR green price tag and divergence attached. Fibo up.

FINAL NOTES:H1, H2, Daily in strong downtrend. Will enter short off resistance.

Buy:

Sell: Entered short off retrace to White. Set TP +40 SL 40.

Adjustments:

+++++

Feb 9, 2017 – pg 398

Hendo

Last nights trade plan, entry, result, and evaluation after trade closed per Dove's instructions.

Session Sydney : EUR/JPY 2/8/2017

Daily Open : Below Purple.

Romar: Resistance

EMA: Resistance

Parabolic: Resistance

Notes: Four Horsemen in steep downtrend. Purple, White, and Smooth crossed Romar. DB down with Blue divergence attachment with green price tag. Fibo up.

H1

Romar: Resistance

EMA: Support

Parabolic: Support

Notes: Four Horsemen in strong up trend. Trend EMA arrow up. MA crossover arrow up. MACD zero cross arrow up. Fibo up.

H2

Romar: Resistance

EMA: Support

Parabolic: Support

Notes: Purple crossed White, Smooth, and EMA up. DB, SAR, Green, Gold Divergence hit off BB with green price tag. Fibo up. Last MACD zero cross arrow up. Trend EMA arrow up. PSAR flipped up. SAR attached with price tag.

FINAL NOTES:H1, H2 up, Will enter long off H2 support after up trend is confirmed by Purple crossing EMA, and PSAR stays down for the up.

Buy: Entered long off retrace to 23.6 Fibo. Set TP +40 SL40

Result: Took +40 pips from the market.

Evaluation: Felt very confident taking this trade Went to sleep after placing, even with SAR attached at entry I felt good about it going up then, DB attaching. Upon review this afternoon, I could have been more patient with my entry. If I could have stayed up later, I definitely would have entered long with the next open candle at Purple. All in all a good trade, didn't lose any sleep, and was nice waking up to +40 pips!

Chad,

+++++

dove_alliance :

Thank you Chad for posting your trade. Your plan and execution was with proficiency.

What makes Chad a very extraordinary trader is because he has heart. Here is a traders realizing the only way to make it in the Forex Market is in learning how to beat the market. Chad does not analyze anything but only follow the rules of trading beginning with a treading plan. He does not jump around trying to find short-cuts but only staying with his objective in believing, having faith, and totally dependent the Paradox will not let him down. It takes a lot of heart and faith to reach this plateau. A plateau of not deviating his true objective of becoming one of the 5%.

On his trade he was patient waiting on the EMA crossing Purple before pulling the trigger. The reason was because the H1 was already in full bloom of the uptrend with the 4 Horsemen; and with the H2 EMA crossing would place both H1 and H2 in the 4 horsemen trend. This also told him the Ranging Mode was over and the breakout was going north. He also knew by applying the rules the trend would override everything else. That is pure faith knowing the truth would prevail. And Chad proved this by pulling the trigger and then went to bed.

Chad is a great example of what makes a great trader. And he would be the first stating he has much more to learn. But no-matter what - he is on the right road of success.

And so everyone knows - I took the same trade - the only difference was I waited on the next open candle.
