

The non loss Bollinger Band, ADX System

I want to explain it in a very short way, so if you have questions please ask me on the forum.

Basics:

- Very aggressive system, the risk is pretty high, pay attention, and save the profit from your account.
- Test it first!
- Trade a lot! We tested the system on 1MIN and on 5MIN, but you can use it on larger timeframes also.

The system:

- We have three indicators. An ADX(14) a Bollinger band(BB)(20,0,2-the standard) and a MA1(Linear Weighted, Median Price).

The +1PIP (or 2,3... cause of the closing delays) is calculated ABOVE THE SPREAD! We make only profitable trades.

If the candle closed below the BB and the ADX is above 40(fine tuning can be required):

Go LONG

The exit is if the candle closing into the BB, and only if the closing is profitable. (An alternate method is, close at +1PIP(or 2-3 cause of the closing delays) immediatly)

If the candle closed above the BB and the ADX is above 40(fine tuning can be required):

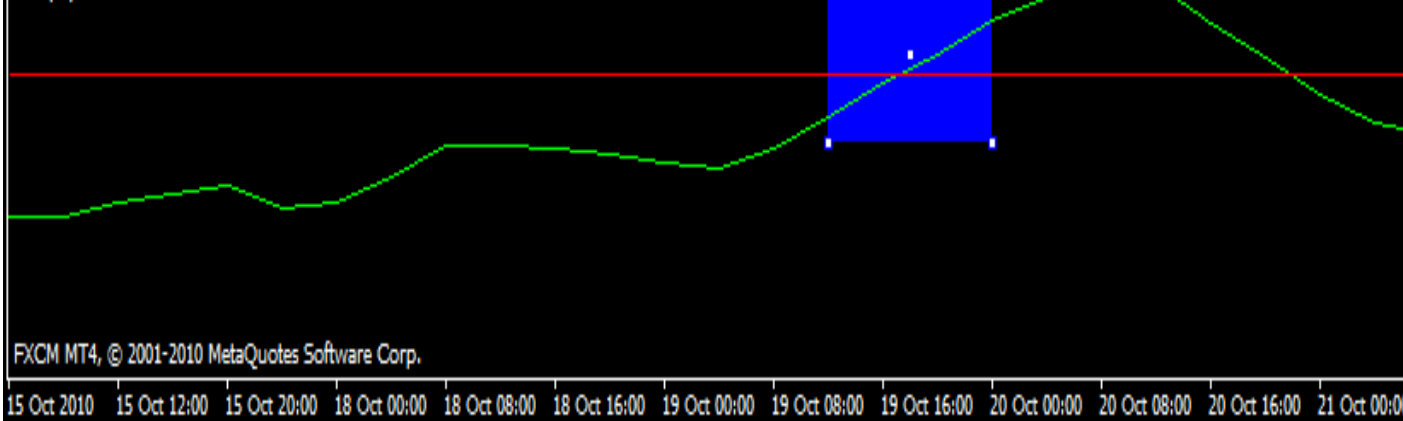

Go SHORT

The exit is if the candle closing into the BB, and only if the closing is profitable. (An alternate method is, close at +1PIP(or 2-3 cause of the closing delays) immediatly)

GBPJPY,H4 130.993 131.075 130.858 130.910

ADX(14) 33.6352 +D1:7.4508 -D1:20.1036

Pretty easy. **What about the dangers?**

The price continue the run, and hit the account into a big Draw Drown.

We have to deal with it. Nanningbob has a **very good BB running indicator(MA1)**. Here is a picture:

If we see the BB Run we DON'T TRADE!

What happens if the EA sadly open a **loser position**?

We use the Hedging system, we make a trade with +1 PIP. How? Here is the picture:
