RENKO SETTINGS FOR Vo.61B11

[Quoting Hotpotato](#)

B, Stupid question, i know. Where can i find the new renko slope modes in Trend ?

Catalin68

Delayed is the way work for renko ..

Slopes mode controls when signals happens. Have 6 modes separate in 2 groups:

Delayed Group

▶ **Continuous.** Signal happens in every candle (BUY/SELL). Neutral areas shows NEUTRAL

● **Slope.** Signal happens in every slope change (BUY/SELL). Neutral areas shows NEUTRAL and future signals are taken

▶▶ **Slope Opposite.** Signal happens in first slope change (BUY/SELL). Neutral areas shows NEUTRAL and future signals are ignored if are same type than first

Current Candle Group

▶ **Open Continuous.** Signal happens in every candle (BUY/SELL). Neutral areas shows NEUTRAL

■ **Open Slope.** Signal happens in every slope change (BUY/SELL). Neutral areas shows NEUTRAL and future signals are taken

▶▶ **Open Slope Opposite.** Signal happens in first slope change (BUY/SELL). Neutral areas shows NEUTRAL and future signals are ignored if are same type than first

Delayed Group is taken when signal candle close. **Current Group** is taken at inside current candle. Signals can change inside candle

B, Stupid question, i know. Where can i find the new renko slope modes in Trend ?

You have 8 modes. First 6 modes are normal. Last 2 (white box with black/gray background) are renko modes (crossover) Attached Image (click to enlarge)

White Box/Black background -> crossover entry (show signal when price cross MA)

White Box/Gray background -> neutral crossover entry (show signal when price cross MA and slope is neutral)

Brain

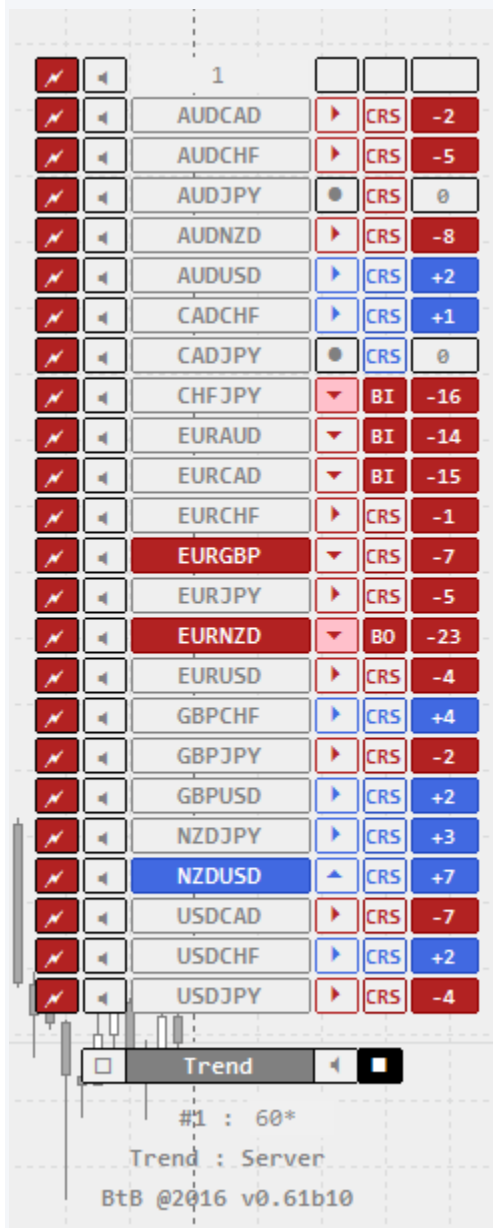

I don't recommend use normal modes with renko because renko filter prices. Use last 2 modes because signal is a cross. This improve a lot entries/exits because you don't have wait slope signal. **We can speak about 2/3 candles faster.** It's huge difference

Trend (vo.61b11)

+ 2 new slope modes for renko

Fast explanation of new modes. Are same then delayed but entry is one candle before (uses current candle). With renko I think this is not a problem and will work well without fake signals (renko filter enough well)

Crossover (top delayed / bottom current candle)

Future Features-Not Implemented Yet

It's experimental but prediction column will try anticipate slope in future builds avoiding some MA lag
