

## **Adapting the multi-pair combined dashboard and auto-trader**

These are the steps you will need to follow to add your own indicators to the EA shell:

1. Rename the shell: it is bloody annoying to forget this.
2. Add the externs, variables arrays and constants that reference the indi.
3. Resize the arrays in void ExtractPairs().
4. Free the array memory in On DeInit().
5. Add values display to void DisplayMatrix() and void DisplayTextLabel(string text, int xpos, int ypos, ENUM\_ANCHOR\_POINT anchor=ANCHOR\_LEFT\_UPPER, string pair="", int tf=0, color scol=clrNONE).
6. Add a function that reads the indicator.
7. Add calls to the indi reading function in void ReadIndicatorValues().
8. Set BuySignal/SellSignal/BuyCloseSignal/SellCloseSignal in ReadIndicatorValues().
9. Add any new closure code to bool LookForTradeClosure(int ticket, int PairIndex).

I have left SuperSlope in the shells to help you; it shows you where you need to add your own code. Do a search for "UseSuperSlope" to locate these points easily.

Have fun.
