

Sonic experience trading journal

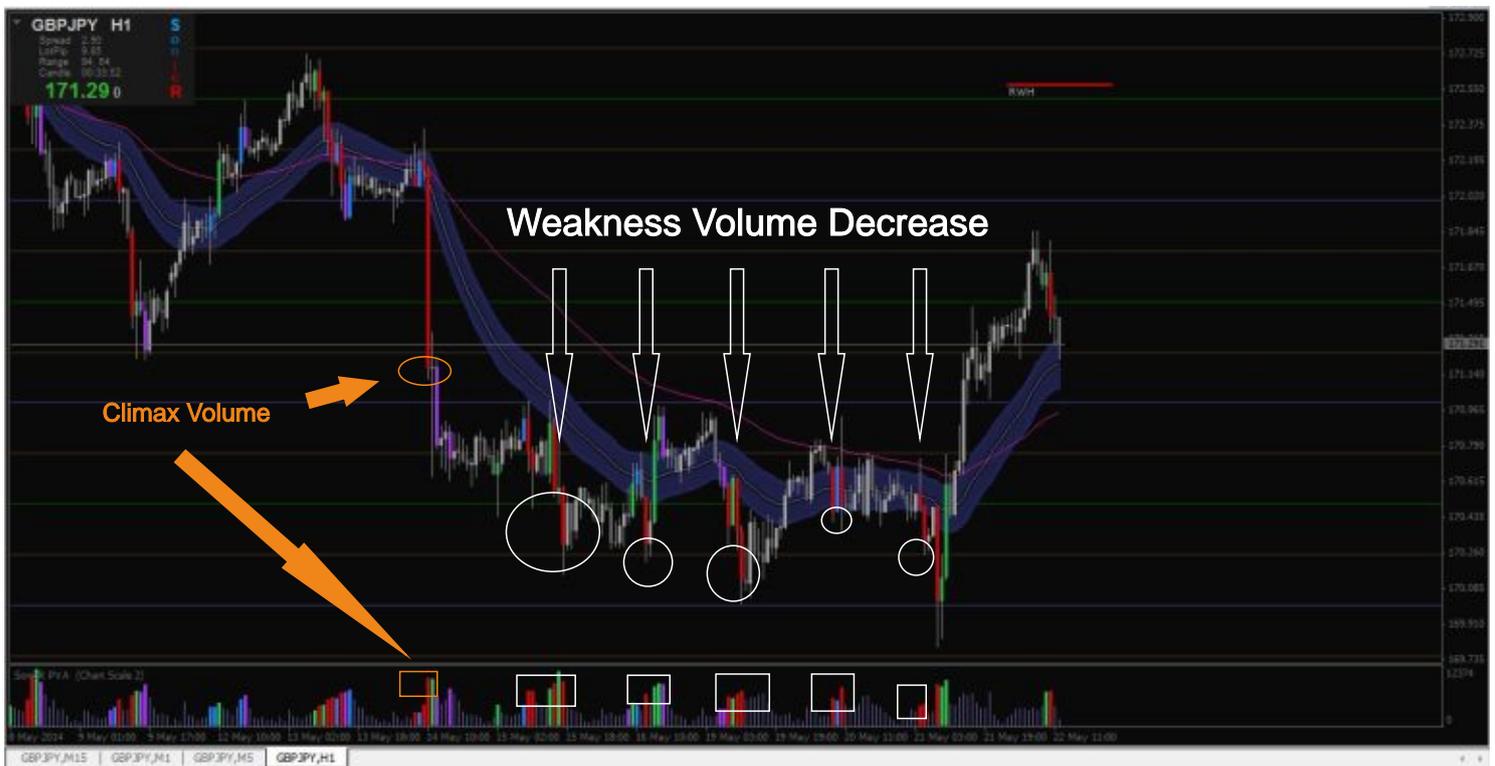

A lesson from bad trade position.

Day by day, trade by trade, each of true blue sonicers struggle and face with unpredicted price behavior by market manipulator. Even with dragon angled into the direction, and PVSRA analysis, each true sonicers still struggled with it, not exception me as a new Sonicers. May, 21st, 2014 is a bad trade that I learn, so now, I care by share my experience that day, so it may be help and enlighten the others about how to react and take a good position.

A total 25% drawdown from my account is a sign that all position is loser position. That's it, even I know that price sometimes will come again into that area, but I decided to cut loss. After that trade, I sat down and review, what I did wrong. Some might say that greed factor comes into play, some might say that careless position, and some might say that too early entry. All is right, but the bottom-line of my mistake trade is not that. I want to share some advice from my mentor that I use to hear every day. He said that; **“Exhaustion gaps get filled. Breakaway and continuation gaps don't.”** That day; “May, 21st, 2014”, I learn it.

I assume all of you have **read and do your homework** like TAH said over and over again. This book is just a compliment and contribution in real time to avoid wrong setup, and to exploit the weakness of the price movement based on sonic setup and PVSRA scout. Let's learn it from the chart below.

Dragon angled down, so let filtered and see only bear candle. Bear Candle means that we pay attention especially for: Red and Purple color. Long and Climax bear candle at initial, and then followed by a ranging period on H1. That ranging period, occasionally shows above average bear candle that stamped with a red and purple color for easier to read and see. That ranging period, shows a weakness of bear. Where is it? That spot that I marked with weakness Volume Decrease. For a while, we can ignore the bull candle (Green and blue mark). The weakness mean that MM need liquidity, or, for a while, they will switch from bear to bull. Closing short and then open long. Pay special attention with timeframe, Intraday swing, just like TAH said, tends to birth and mature on H1 chart. Sometimes, things that not showed in H4 Timeframe (after that we called TF), will show clearly on H1 TF. Some Sonic haters say there are no exact volumes on forex. That's true; the volume count is just a tick (count of change price pip) count. Tick, can represent the interest of Market Manipulator (after that: MM).

By knowing this weakness, we already know, that proper and logical position search is long. That's the part of PVSRA in application. Then when to entry? Again, **Sonic Classic setup** on smaller TF (like M5 or M15). *Buy the first pullback from a new high. Sell the first pullback from a new low. There's always a crowd that missed the first boat.* That's sentences is often heard by all of us. That's the principal of Sonic Classic System.

Things to remember, that even classic setup occur, somehow MM shakes the price to trigger stop and cause fear for trader that in direction with them (MM Position). Chart will show it better...

Some questions arrive, where we should put a stop? Or when we should stop manually? It's depending on condition and risk. But personally, I avoid placing stop near big figure like 00, or 50. Finally, when you decide to enter, at those time, you've should prepare when and where to exit? By knowing the risk before enter, a shakes like stop hunting on above chart will never shake our mental...

Last, good luck, and may lot of pips goes with us.
