

BUB: Bullish bar – this is a bar that closes above the open and in the top third to quarter of the bar. The higher the better.

BEB: Bearish bar – this is a bar that closes below the open and in the bottom third to quarter of the bar. The lower the better.

PB: Pinocchio bars – this bar is when the open and close are within the prior bar and the body is long/petruedes. coined by martin pring it is lying to you. its telling you one thing and going to do the opposite. best played at swing highs and lows or at support/resistance.

This one bar can, when mastered, give you all you will ever need to trade successfully. You will see subscribers and me talk about it a lot and for very good reasons.

BUOB: Bullish outside bar – this is a bar where the high is higher than the previous bars high and lower than the previous bars low. Preferably the close will be in the top third to quarter of the bar. The higher the better.

BEOB: Bearish outside bar – this is a bar where the low is lower than the previous bars low and higher than the previous bars high. Preferably the close will be in the bottom third to quarter of the bar. The lower the better.

IB: Inside bars – this bar is the opposite of the outside bar. the high and low are inside the previous bar. there is no bullish or bearish description to these bars. they represent indecision in the marketplace. they can signal a trend reversal or a continuation of a current trend. you tend to see them when a market is ranging.

DBLHC: bullish this is a double bar high with a lower close. two consecutive bars with the lows being equal and the close of the second bar outside/ below the previous bar. NOTE: every once in a while you will see a triple bar (or more) low or high with a higher or lower close. these are very reliable

DBHLC: bearish this is a double bar high with a lower close. Two consecutive bars with highs being equal and the close of the second bar outside/ below the previous bar. NOTE: every once in a while you will see a triple bar (or more) low or high with a higher or lower close. these are very reliable

TBH OR TBL: these are two bar highs and lows. you look for them in strong trends as a breakout point.
