

Hi team,

Hope everyone had a great weekend. I understand some of you new dashboard members have some concerns. Let me address them now.

I see some of you are concerned about something called “repainting”. I believe this term means the “indicator” or in our case Dashboard will change direction many times. Let me explain something first.

I see you guys are saying USD/CHF changed from 2 PFH to 4 PFL. Okay so the reason why USD/CHF is now PFL is because market makers decided they are going to start a bullish cycle. You should have not even been in USD/CHF in the first place?? There is absolutely no pattern or reason to enter short, so this is on you... No Shark fin, no stop hunt high nothing.

1st screenshot is H1 and 2nd one is M15 timeframe. Absolutely no shark fin stop hunt to give you the setup to short this pair? If anything if you look to where my arrow is pointing, we had a stop hunt shark fin low indicating bullish direction. Let's continue...

USD/CAD changed from 2 PFH to 14 PFL because once again, market makers have decided they will change direction and a new trend has started.

PAIR	PFH	PFL	STATUS :
EURZAR	2.61	0.86	✓ 1 PFL
USDMXN	4.02	0.85	✓ 1 PFL
EURUSD	0.54	1.52	2 PFL
EURCHF	0.80	2.16	2 PFL
USDCAD	1.07	2.42	2 PFH
USDCHF	0.74	0.98	2 PFH
GBPNZD	1.51	0.00	2 PFH
NZDJPY	1.66	1.23	2 PFL
NZDUSD	0.00	1.69	2 PFL
XAGUSD	0.91	0.97	2 PFL

USDJPY	2.09	0.00	12 PFH
NZDJPY	2.89	1.94	✓ 13 PFH
USDCAD	1.53	3.64	✓ 14 PFL
CADJPY	3.05	1.60	14 PFH
GBPJPY	6.38	0.00	14 PFH

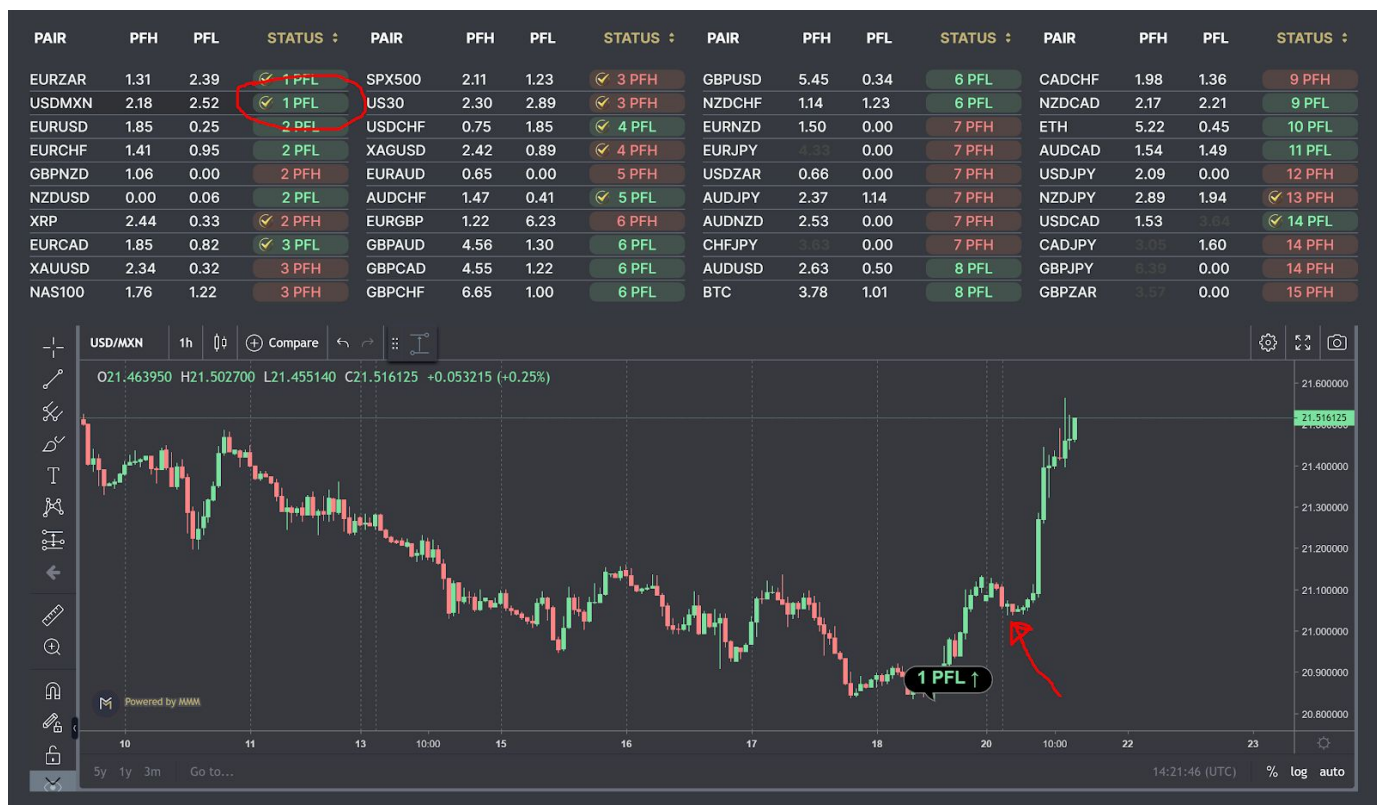

So USD/CAD absolutely has no pattern to short? No shark fin stop hunt high on TDI? Why would you be in this trade short?

So what I am trying to say here is you under no circumstances randomly trade anything just because dashboard says PFH or PFL. Dashboard is a professional tool with many purposes including giving you insight on new Market Maker trends being established. **NOTE:**

(Market Makers can change direction anytime they want for any reason they want. Whether it's to move the crosses, create a reset immediately which just means to continue the trend in the direction previously, etc...) Market Maker trends can change due to any circumstances, so just because dashboard shows a peak (trend) is locked in, economic news or smart money related injections into the markets can change this immediately.

So why isn't anyone talking about all of the other pairs that have indeed moved perfectly inline with dashboard today such as USD/MXN and EUR/ZAR and many more? Let's take a look...

USD/MXN above, moved over 500 PIPS to the upside perfect Dashboard trade... Let's look at EUR/ZAR. 550+ Pips...

This week we are making amazing changes to Dashboard. Our Masterclass Trading Course, if you don't already know is available only to dashboard members for an additional cost which basically teaches exactly How I trade and my signature pattern which gives you everything you need to use with dashboard and be consistent. NOW Masterclass I am going to discontinue it forever so I will hold a small sale to everyone before it goes.

Why? Because I will be summarizing a small part of the masterclass the part where I teach about "The Proper 1st Leg Shark Fin" which is the #1 most important part before taking any dashboard trade **PERIOD!**

So this weekend expect to see that sale for those of you who want to get the entire course 10+ hours otherwise after the sale I am going to upload a short summary of our winning strategy using dashboard to the University for all Dashboard members to review.
